                                                                                                                                                                                                                                                                                              ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences an also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequence can be used to screen for compounds able to interfere with the S. epidermidis life Cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Carr GJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          744 ITAATATITITCITAGAAAATCAAGTITACGATCATAAATATITITCIGCGATATAGCTITG

```
This invention describes novel expression cassette (EC) containing at least one each of plant promoter (P) and structural gene (SG) expressed in plants, flanked by specific restriction enzyme (RE) recognition sites. The EC has the structure (LI-P-SG-L2) in where Li = is a polylinker sequences reproduced (ABQ7629-ABQ7600) or equivalent RE-site-containing sequences and n = 1-3. The invention discloses a vector containing the EC, an organism containing the EC or the vector and a transgenic plant containing a fnon-) functional nucleic acid in the vector. Transgenic plant esq linseed can be prepared with improved production of fatty acid esters with an increased content of polyunsaturated fatty acids (PUFA), useful in animal and human nutrition, cosmetics and pharmaceuticals, e.g. protect against heart disease. The expression casettes of the invention protect against heart disease. The expression casettes of the invention protection in the blood and to protect against heart disease. The expression casettes of the invention (especially PUFA), including seed specific production. This sequence represents a nucleic acid sequence used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

The invention relates to preparing (M1) fatty acid esters (I) with anomoreased content of polyunsaturated fatty acids (II) with at least two double bonds by introducing into a (I)-producing organism a specific nucleic acid (A). (M1) is useful for preparing ester containing to polyunsaturated fatty acids. Oils, lipids and (II) or their fractions, produced by (M1) are used in animal and human nutrition, cosmetics and parmaceuticals, e.g. (II) are known to reduce levels of cholesterol in the blood and to protect against heart disease. Cells that express (A) are also used to identify (ant)agonists of desaturases, e.g. for modulating the yield and rate of production of particular fine chemicals in microorganisms (claimed). Also (A) and derived proteins can be used as structural studies. (M1) is suitable for large scale production (no known structural studies. (M1) is suitable for large scale production (no known bloongineering method can produce (II) on a useful scale). The present sequence is that of a pucil based expression vector with a plant specific promoter and terminator surrounding the site for insertion of an

This invention describes novel expression cassette (EC) containing at least one each of plant promoter (P) and structural gene (SG) expressed in plants, flanked by specific restriction enzyme (RE) recognition sites. The EC has the structure (11-P-SG-12) in where it is a polylinker sequences reproduced (ABQ7799-ABQ7861) or equivalent RE-site-containing sequences reproduced (ABQ7799-ABQ7861) or equivalent RE-site-containing the EC or the vector and a transgenic plant on organism containing the EC or the vector and a transgenic plant EC, an organism containing the EC or the vector and a transgenic plant containing a mon-luncian nucleic acid in the vector. Transgenic plants et a linesed can be prepared with improved production of fatty acid esters with an increased content of polyumsaturated fatty acids (PUPA), useful in animal and human nutrition, cosmetics and pharmaceuticals, e.g. PUFA are known to reduce levels of cholesterol in the blood and to protect against heart disease. The expression cassettes of the invention of the containing the provise in the production of fine chemicals. (especially PUFA), including seed-specific production. This sequence represents a nucleic acid sequence used to illustrate the method of the

Preparing ester containing polyunsaturated fatty acids, useful e.g. animal or human nutrition, by transforming organism with desaturase

The invention relates to preparing (M1) fatty acid esters (I) with an increased content of polyunsaturated fatty acids (II) with at least two

double bonds by introducing into a (I)-producing organism a specific nucleic acid (A). (M1) is useful for preparing ester containing polyunsaturated fatty acids. Oils, lipids and (II) are their fractions, produced by (M1) are used in animal and human nutrition, cosmetics and pharmaceuticals, e.g. (II) are known to reduce levels of cholesterol in the blood and to protect against heart disease. (Calls that express (A) are also used to identify (ant) agoinst so desaturases, e.g. for modulating the yield and rate of production of particular fine chemicals in microrganisms (claimed). Also (A) and derived proteins can be used as markers of specific genomic regions and in evolutionary/protein structural studies. (M1) is suitable for large scale production (no known bioengineering method can produce (II) on a useful scale). The present sequence is that of a puct3 because expression vector with a plant specific promoter and terminator surrounding the site for insertion of an expression cassette \$

preparing polyunsaturated New expression cassette for plant genes, useful for transgenic plants that have increased production of fatty acids

Example 13; Page 95-103; 188pp; German.

This invention describes novel expression cassette (EC) containing at least one each of plant promoter (P) and structural gene (SG) expressed in plants, flamked by specific restriction enzyme (RE) recognition sites. The EC has the structure (II-P-SG-L2) In where II = is a polylinker (ABQ76798), L2 = any of three synthetic polylinker-terminator-polylinker

```
sequences and n = 1-3. The invention discloses a vector containing sequences and n = 1-1. The invention discloses a vector containing this EC, an organism containing the EC or the vector and a transgenic plant containing a floor) functional nucleic acid in the vector. Transgenic plants e.g linseed can be prepared with improved production of fatty acid esters with an increased content of polyunsaturated fatty acids (PUFA), useful in animal and human nutrition, cosmetics and pharmaceuticals, e.g. PUFA are known to reduce levels of cholesterol in the blood and to protect against heart disease. The expression casettes of the invention provide increased and more efficient production of fine chemicals (especially PUFA), including seed-specific production. This sequence represents a nucleic acid sequence used to illustrate the method of the
sequences reproduced (ABQ76799-ABQ76801) or equivalent RB-site-containing sequences and n = 1-3. The invention discloses a vector containing this

Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial BCORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP from the and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

BX415878 Homo sapiens THYMUS Homo sapiens cDNA clone CS0CAP008YI04 5-PRIME, mRNA sequence.

LOCUS DEFINITION

```
/tissue type="THYMUS"
/clone lib="Homo sapiens THYMUS"
/note="Vector: pcNVSPORT_6; lst strand cDNA was primed
with a NotI-oligo(dT) primer. Five prime end enriched,
double-strand cDNA was digested with Not I and cloned into
the Not I and EcoRV sites of the pCMVSPORT 6 vector.
Library was not normalized." 170 others
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Geogawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named REDI-98 and was constructed by partial EcoxI digestion of Drosophila DNA, provided by the BDGP from the isogenic strain v2; no bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be botain.com.in.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ŋ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ij
